Software Testing Assignment

AbleSpace Staging Application

Manual QA Testing Report

Prepared by: Abhishek Singh
Role: Software Tester (QA)

Application: AbleSpace
Environment: Staging
Testing Date: 06–07 October 2026

Prepared as part of the QA practical assignment

Contents

1 Test Environment and Setup **2**
1.1 Application . . . 2
1.2 Primary Test Environment . . . 2
1.3 Test Data . . . 2
1.4 Testing Scope . . . 2

2 Exploratory Testing **3**
2.1 Additional Exploratory Observations . . . 3
2.2 Supporting Student-Management Evidence . . . 4

3 Detailed Test Cases **6**
3.1 TC-01 – Create Accuracy Goal . . . 6
3.2 TC-02 – Record Correct and Incorrect Responses . . . 7
3.3 TC-03 – Record a Prompt Without Adding an Attempt . . . 8
3.4 TC-04 – Verify Accuracy Calculation in Graph and Stats . . . 8
3.5 TC-05 – Edit Session Data from the Data Page . . . 9
3.6 TC-06 – Verify Edited Session Data Persists Across Views . . . 11

4 Bug Reports **13**
4.1 BUG-001 – Email Verification Link Fails . . . 13
4.2 BUG-002 – Role Dropdown Accepts Arbitrary Values . . . 14
4.3 BUG-003 – Session History Is Difficult to Read on Mobile Web . . . 16
4.4 Additional Observations . . . 17

5 Compatibility Testing **17**
5.1 Desktop and Mobile Web Compatibility Matrix . . . 18
5.2 Tablet Compatibility . . . 18
5.3 Compatibility Evidence . . . 18
5.4 Plan-Restricted and Unsent Actions . . . 21

6 Testing Summary **21**
6.1 Testing Performed . . . 21
6.2 Issues Found . . . 21
6.3 Areas Not Tested . . . 21
6.4 What I Would Test Next . . . 21

A Evidence Checklist **22**

B Final Notes **23**

1. Test Environment and Setup

1.1 Application

Testing was performed on the AbleSpace – IEP Goal Tracking App staging application:

staging.ablespace.io

The testing was performed using one manually created test account, as required by the assignment. Fictional student and profile data was used during testing.

1.2 Primary Test Environment

- Operating environment: Desktop
- Primary browser: Google Chrome 154.0.8037.98 (64-bit)
- Additional browsers: Mozilla Firefox and Microsoft Edge
- Mobile web viewport: 390 × 844
- Tablet emulation: iPad Mini and iPad Pro 13-inch
- Testing type: Manual functional, exploratory, validation, usability, and compatibility testing

1.3 Test Data

The following fictional data was used:

- Test user name: Aarav Mehta
- Test student: Maya Sharma
- School: Green Valley School
- Goal: Reading
- Goal description: Maya will correctly read simple words with 80% accuracy.

No real student or customer data was intentionally used.

1.4 Testing Scope

The following areas were covered:

- Account onboarding
- Role selection
- Email verification
- Student creation and editing
- Student search
- Goal creation
- Data collection
- Session editing
- Activity and History
- Collaborator interface inspection
- Responsive/mobile web layout
- Cross-browser compatibility
- Tablet compatibility

Security testing, penetration testing, load testing, and performance testing were not performed because they were outside the assignment scope.

2. Exploratory Testing

Exploratory testing was performed by navigating through important application workflows and checking normal, negative-input, validation, and usability conditions.

ID	Scenario	Result
ET-01	Account onboarding with valid fictional information	PASS – Account creation and onboarding flow completed successfully.
ET-02	Role dropdown with predefined roles	PASS – Predefined roles could be selected and the dropdown behaved normally.
ET-03	Role dropdown with arbitrary text	FAIL – Arbitrary text such as `xyzabc123` appeared as a selectable option in a field presented as a role dropdown. This was recorded as BUG-002.
ET-04	Password validation during onboarding	PASS – Password length and strength feedback were displayed.
ET-05	Privacy Policy checkbox validation	PASS – Continue remained disabled until the required checkbox was selected.
ET-06	Create and search for a student	PASS – Maya Sharma was created successfully and could be found using search.
ET-07	Edit student information	PASS – School information was updated successfully and persisted after returning to the profile.
ET-08	Create a goal and collect data	PASS – A Reading goal was created and correct/incorrect responses and prompts could be recorded.
ET-09	Edit and persist an existing data session	PASS – A Correct response was added through the Capture view, the application displayed "All changes Saved", and the updated counts were reflected in Stats.
ET-10	Responsive and cross-browser testing	PARTIAL / FAIL – Desktop browser checks passed, but the 390 × 844 mobile web check exposed a Session History readability issue, which was recorded as BUG-003.

2.1 Additional Exploratory Observations

During onboarding, the email verification link received after account creation led to a verification page displaying an "expired or already used" message when the verification action was completed.

The application continued to indicate that the email had not been confirmed. A verification-status indicator or successful verification state was not observed in the Profile Settings area during the testing performed.

The Role dropdown allowed arbitrary text such as `xyzabc123` to appear as a selectable option. This behavior was promoted to BUG-002 because the control is presented as a role-selection field and permits an unsupported arbitrary value to become selectable.

The student First Name field accepted and saved a numeric-only value. This was retained as an input-validation observation because the assignment did not provide an explicit naming rule

requiring alphabetic-only names.

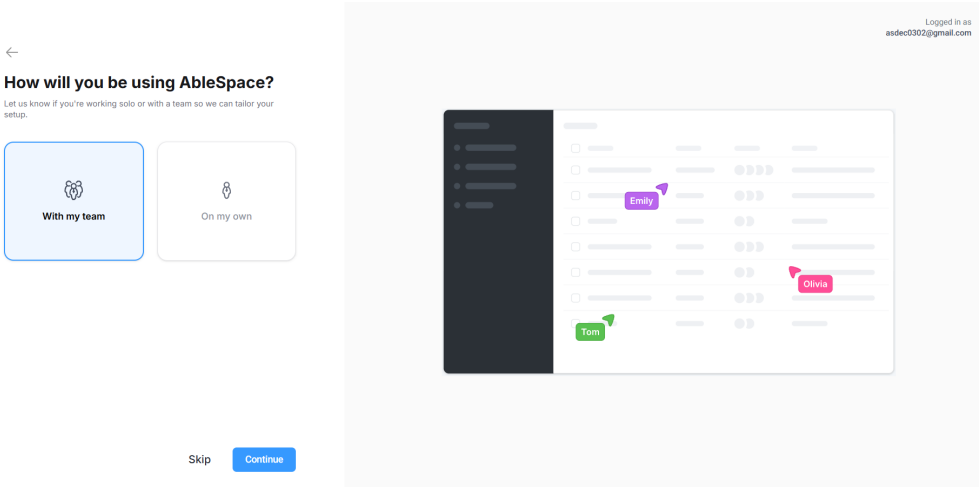

Figure 1: AbleSpace onboarding screen for selecting team or individual usage.

2.2 Supporting Student-Management Evidence

The following screenshots provide supporting evidence for the student-management exploratory scenarios.

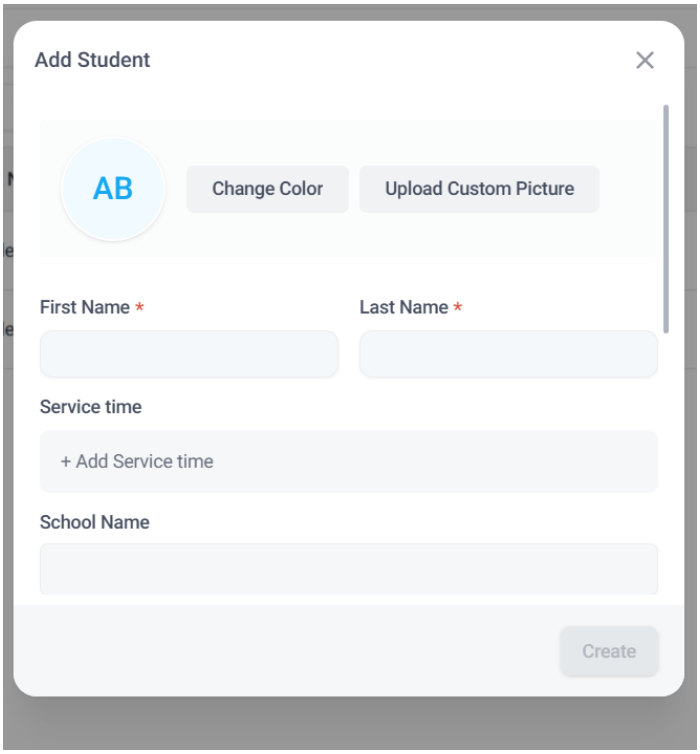

Figure 2: Supporting evidence: Student creation form and fictional student data.

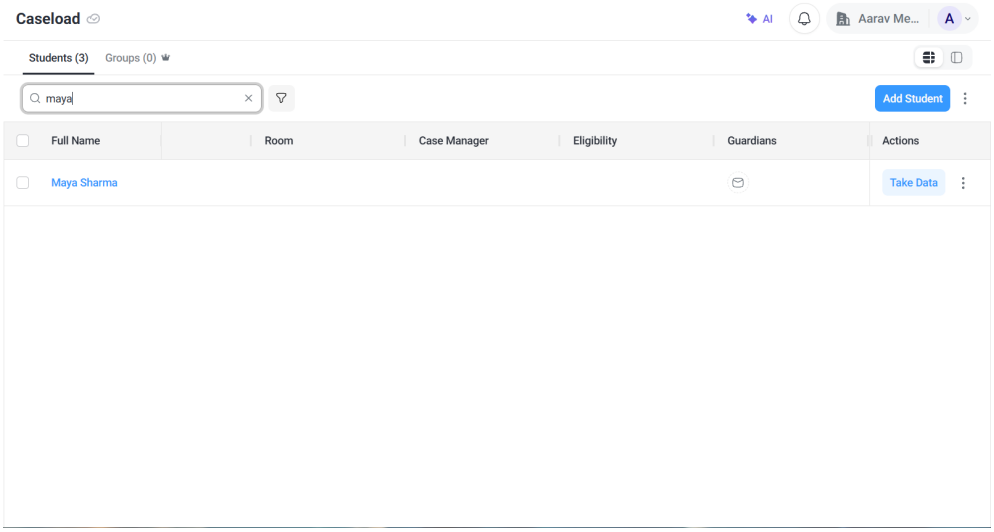

Figure 3: Supporting evidence: Positive student search finding Maya Sharma.

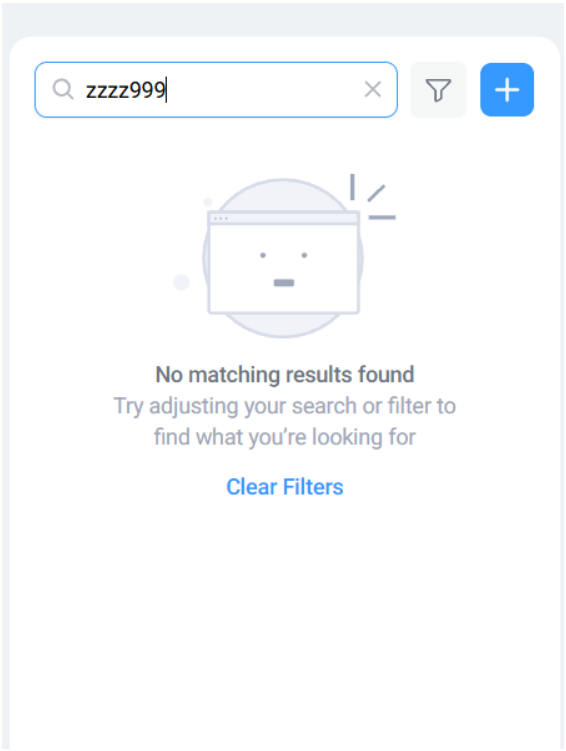

Figure 4: Supporting evidence: Negative student search showing no matching results.

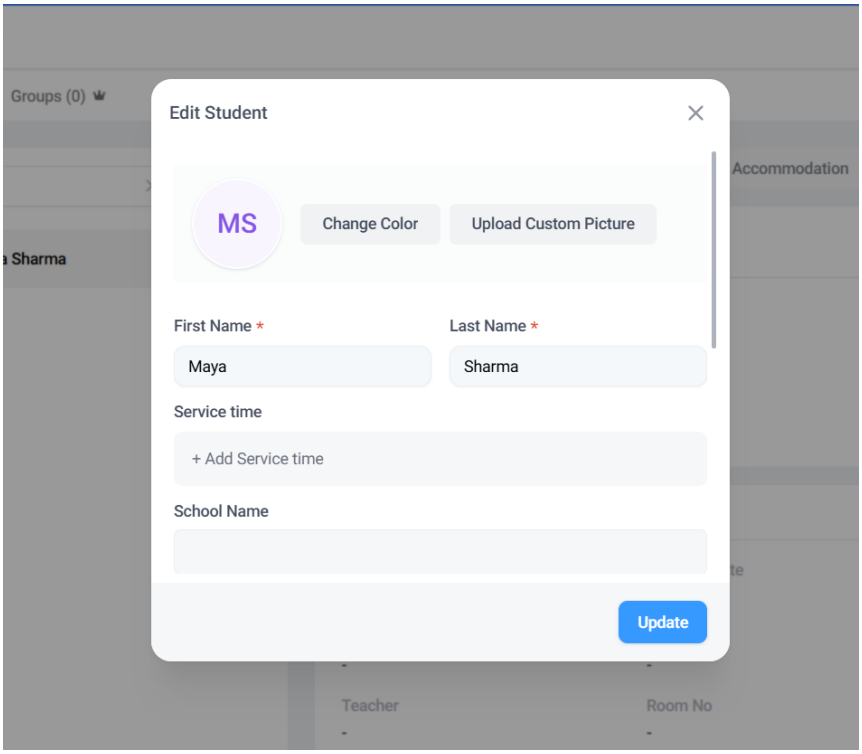

Figure 5: Supporting evidence: Student profile showing the edit option to update the information.

3. Detailed Test Cases

Chosen workflow: Create Goal → Record Data → Review Session Statistics → Edit Session Data → Verify Saved Results.

Why this workflow: It is a core data-collection workflow where incorrect recording or saving could directly affect the accuracy of student progress information.

The following six test cases cover positive, calculation, prompt-tracking, editing, and persistence-related checks within this workflow.

3.1 TC-01 – Create Accuracy Goal

TC ID	TC-01
Title	Create Accuracy Goal
Preconditions	Maya Sharma is available and the goal/data workflow can be opened.
Test Data	Goal Title: Reading; Description: Maya will correctly read simple words with 80% accuracy; Measurement: Accuracy.
Steps	1. Open the data/goal workflow for Maya Sharma. 2. Select **Add Goal**. 3. Enter the goal title and description. 4. Select **Accuracy** as the measurement type. 5. Save the goal.
Expected Result	The Reading goal is created and displayed in the goal list.
Actual Result	The Reading goal was created successfully and displayed in the goal list.
Status	PASS

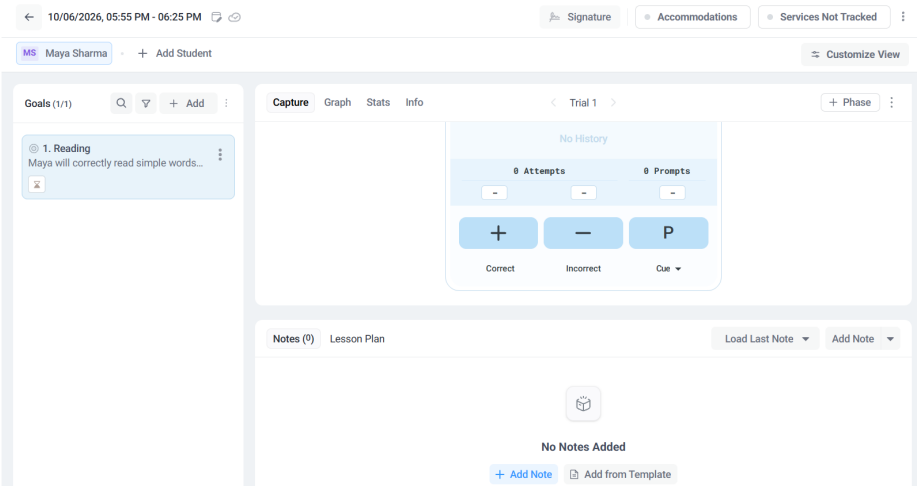

Figure 6: TC-01 evidence: Reading goal created using Accuracy measurement.

3.2 TC-02 – Record Correct and Incorrect Responses

TC ID	TC-02
Title	Record Correct and Incorrect Responses
Preconditions	An Accuracy goal exists for Maya Sharma.
Test Data	One Correct response and one Incorrect response.
Steps	1. Open the data-capture screen. 2. Select the Correct (+) control once. 3. Select the Incorrect (-) control once. 4. Observe Attempts, Correct, Incorrect, and Accuracy.
Expected Result	Attempts increases to 2, Correct is 1, Incorrect is 1, and Accuracy is 50%.
Actual Result	Attempts became 2, Correct was 1, Incorrect was 1, and Accuracy displayed 50%.
Status	PASS

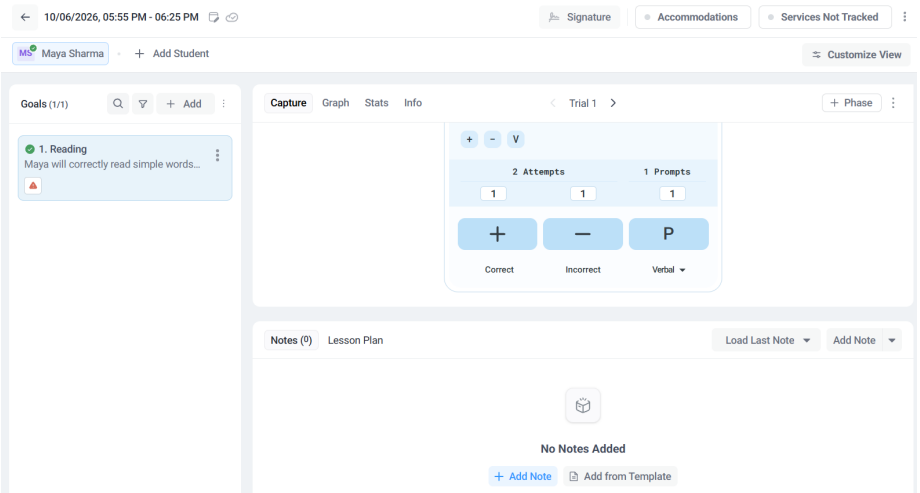

Figure 7: TC-02 evidence: Data capture showing recorded Correct and Incorrect responses.

3.3 TC-03 – Record a Prompt Without Adding an Attempt

TC ID	TC-03
Title	Record a Verbal Prompt
Preconditions	An Accuracy goal exists and two responses have already been recorded.
Test Data	Prompt type: Verbal.
Steps	1. Open the prompt options. 2. Select **Verbal**. 3. Record one prompt using the prompt control. 4. Observe Attempts and Prompts.
Expected Result	Prompts increases by one, the prompt type is recorded as Verbal, and Attempts does not increase merely because the prompt is recorded.
Actual Result	Prompts increased to 1, the prompt was recorded as Verbal, and Attempts remained at 2.
Status	PASS

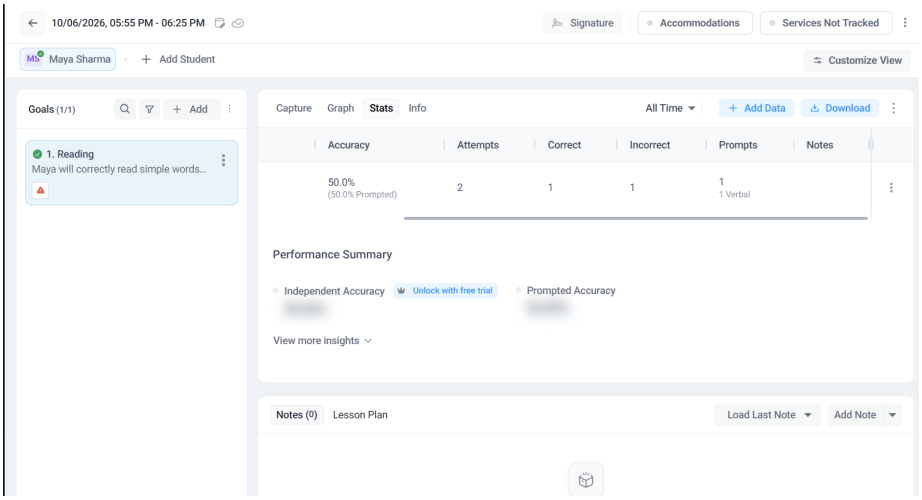

Figure 8: TC-03 evidence: Session statistics showing the recorded Verbal prompt.

3.4 TC-04 – Verify Accuracy Calculation in Graph and Stats

TC ID	TC-04
Title	Verify Accuracy Calculation
Preconditions	Two responses exist: one Correct and one Incorrect.
Test Data	Expected Accuracy: $1/2 = 50\%$.
Steps	1. Open the **Graph** tab. 2. Verify the displayed accuracy. 3. Open the **Stats** tab. 4. Compare the Accuracy value with the recorded response counts.
Expected Result	Both views report 50% accuracy for the session.
Actual Result	The Graph displayed 50% accuracy and the Stats view also displayed 50%.
Status	PASS

3.5 TC-05 – Edit Session Data from the Data Page

TC ID	TC-05
Title	Edit Saved Session Data from the Data Page
Preconditions	A saved session exists for Maya Sharma with recorded data.
Test Data	Existing values: Correct = 4, Incorrect = 1, Prompts = 2. Change Correct from 4 to 5.
Steps	1. Open the **Data** page from the left navigation. 2. Locate Maya Sharma's saved session. 3. Open the session's three-dot action menu. 4. Select **Edit Session**. 5. Change the Correct count from 4 to 5. 6. Verify the calculated Accuracy changes to 50%. 7. Click **Save**.
Expected Result	The edited Correct value is accepted, Attempts and Accuracy are recalculated correctly, and the Save action completes successfully.
Actual Result	Correct became 5, Incorrect remained 1, Prompts remained 2, Attempts became 6, Accuracy displayed 50%, and the edited session was saved successfully.
Status	PASS

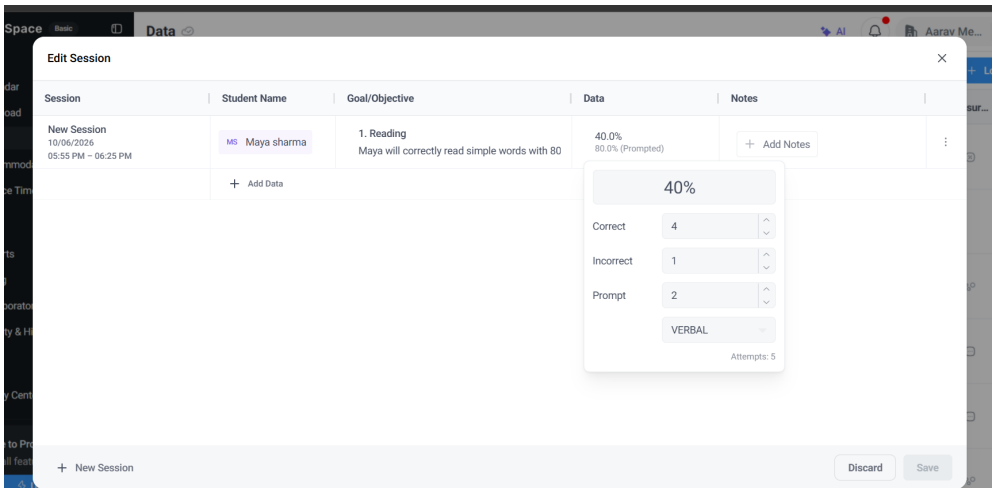

Figure 9: TC-05 evidence: Data-page Edit Session dialog showing the session data before the edit.

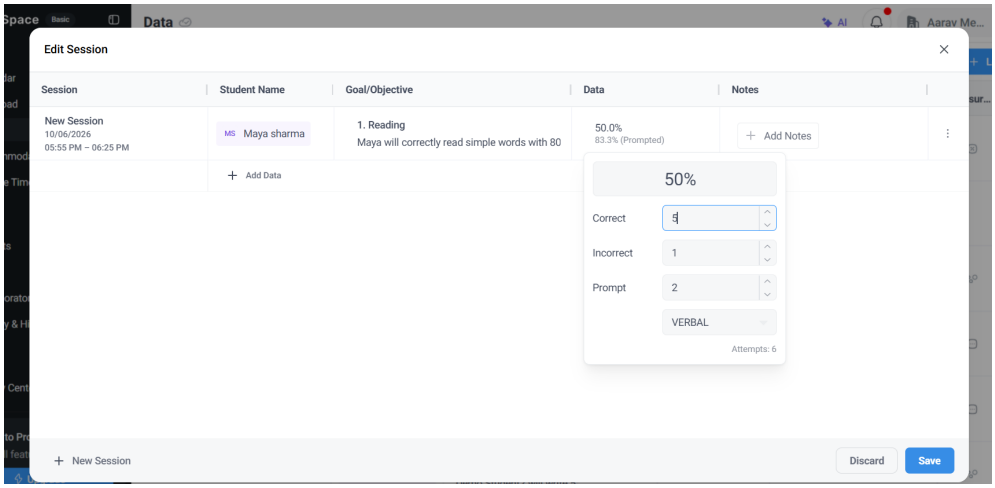

Figure 10: TC-05 evidence: Edit Session dialog after changing Correct from 4 to 5, showing 50% Accuracy and 6 Attempts.

3.6 TC-06 – Verify Edited Session Data Persists Across Views

TC ID	TC-06
Title	Verify Edited Session Data Persists Across Views
Preconditions	TC-05 has been completed successfully and the edited session has been saved.
Test Data	Expected persisted values: Correct = 5, Incorrect = 1, Prompts = 2, Attempts = 6, Accuracy = 50%.
Steps	1. Return to the **Data** page. 2. Locate Maya Sharma's saved session. 3. Verify that the session summary displays 50% Accuracy. 4. Open **Caseload**. 5. Open Maya Sharma's **View Data**. 6. Open the **Stats** tab. 7. Verify that the same updated session values are displayed.
Expected Result	The values saved in TC-05 remain unchanged and consistent when the same session is viewed from the Data page and the Stats view.
Actual Result	The Data page displayed 50% Accuracy. The Caseload → View Data → Stats workflow also displayed 50% Accuracy with 6 Attempts, confirming that the edited session data persisted across views.
Status	PASS

TC-06 Evidence: The following screenshots verify that the edited session values persisted across the two available views.

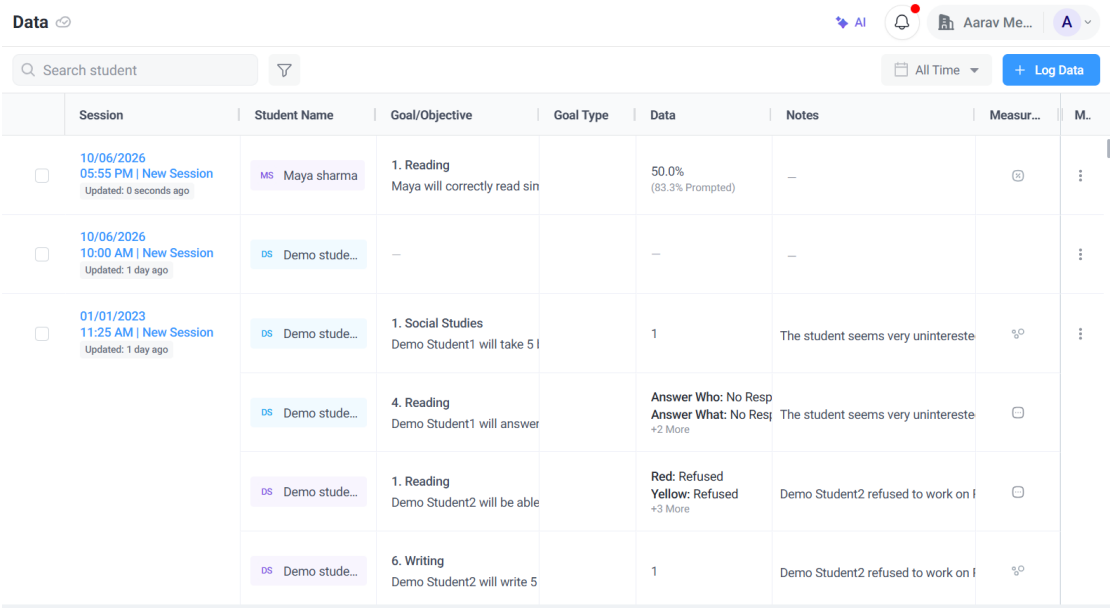

Figure 11: TC-06 Evidence 1: Data page showing the persisted 50% Accuracy after saving the edited session.

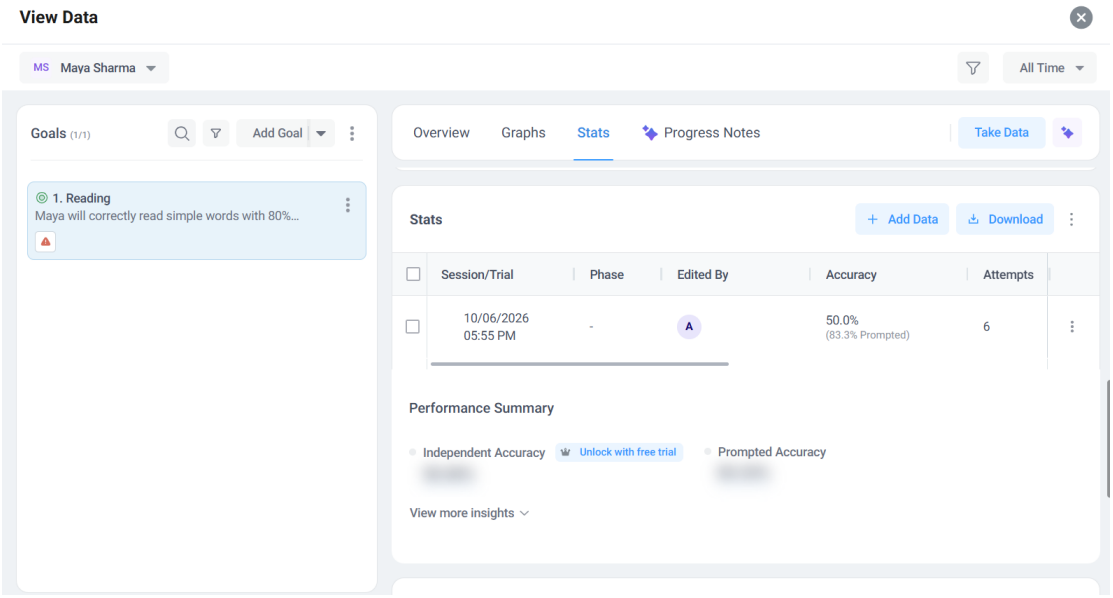

Figure 12: TC-06 Evidence 2: Caseload → View Data → Stats showing 50% Accuracy and 6 Attempts.

4. Bug Reports

Three issues were selected for detailed reporting. The reports below focus on reproducible user-visible behavior and avoid assuming an internal root cause.

4.1 BUG-001 – Email Verification Link Fails

Bug ID: BUG-001

Title: Newly received email verification link displays "expired or already used"

Severity: High

Priority: High

Environment: https://staging.ablespace.io, tested 06–07 October 2026

Browser / Device: Google Chrome 154.0.8037.98 (64-bit), Desktop

Reproducibility: Observed once during testing; not retested with a resend

Steps to Reproduce:

1. Create an account using fictional test information.
2. Open the verification email received after account creation.
3. Click the "Verify Email" link.
4. On the verification page, click "COMPLETE VERIFICATION".
5. Observe the resulting verification status.

Expected Result: The newly received verification link should successfully verify the account and the application should reflect the verified state.

Actual Result: The verification page displayed an error indicating that the request had expired or the link had already been used. The application continued to indicate that the email had not been verified.

Impact: The user cannot complete the normal email-verification workflow using the verification link received immediately after account creation. This affects an important account-level onboarding function.

Evidence:

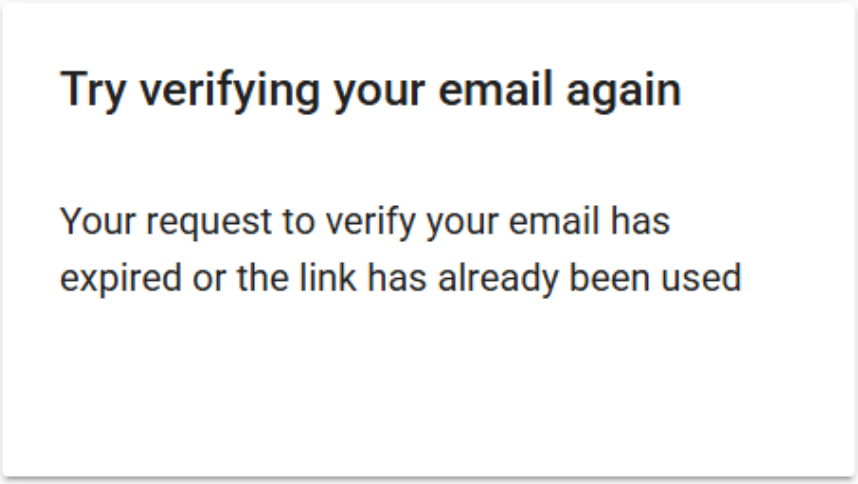

Figure 13: BUG-001 evidence: Email verification page displaying the "expired or already used" message.

Evidence hygiene: Any verification URL, token, or personal email address should be cropped or hidden before submission.

Note: The ability to change the email address from Profile Settings was observed after account creation, but it was not promoted to a bug because the assignment did not establish a requirement that the email address must remain immutable after signup.

4.2 BUG-002 – Role Dropdown Accepts Arbitrary Values

Bug ID: BUG-002

Title: Role dropdown allows arbitrary typed values to become selectable roles

Severity: Medium

Priority: High

Environment: `https://staging.ablespace.io`, tested 06–07 October 2026

Browser / Device: Google Chrome 154.0.8037.98 (64-bit), Desktop

Reproducibility: Always during the tested interaction

Steps to Reproduce:

1. Open the signup/onboarding flow.
2. Focus the **Role** dropdown.
3. Type an arbitrary value such as `xyzabc123`.
4. Observe the options displayed by the control.
5. Select the arbitrary value.

Expected Result: The Role control should allow selection only from supported/predefined roles, unless custom role creation is explicitly supported.

Actual Result: An arbitrary value such as `xyzabc123` appeared as a selectable option in the Role control and could be selected.

Evidence:

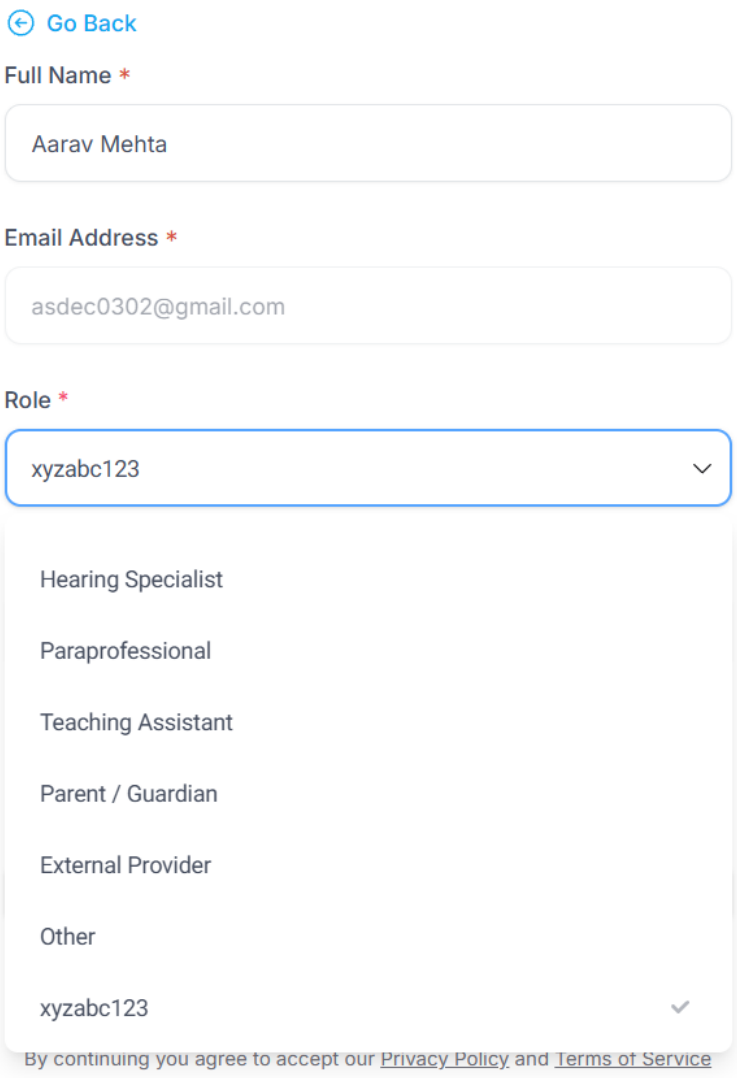

Figure 14: BUG-002 evidence: Role control displaying an arbitrary typed value as a selectable option.

Note: No backend/root-cause assumption is made. The defect is reported from the user-visible validation behavior of the role control.

4.3 BUG-003 – Session History Is Difficult to Read on Mobile Web

Bug ID: BUG-003

Title: Session History information is difficult to read at a 390 × 844 mobile web viewport

Severity: Medium

Priority: Medium

Environment: https://staging.ablespace.io, tested 06–07 October 2026

Browser / Device: Google Chrome 154.0.8037.98, responsive mobile web viewport 390 × 844

Reproducibility: Always during the tested viewport interaction

Steps to Reproduce:

1. Open the AbleSpace staging application at a 390 × 844 mobile web viewport.
2. Open **Activity & History**.
3. Open **Session History**.
4. Inspect the session-history table.

Expected Result: Session History information should remain clearly readable and usable at the mobile viewport through an appropriately responsive layout or clearly presented table scrolling.

Actual Result: The table required horizontal scrolling and important information was not clearly visible within the initial viewport, making the session data difficult to read.

Evidence:

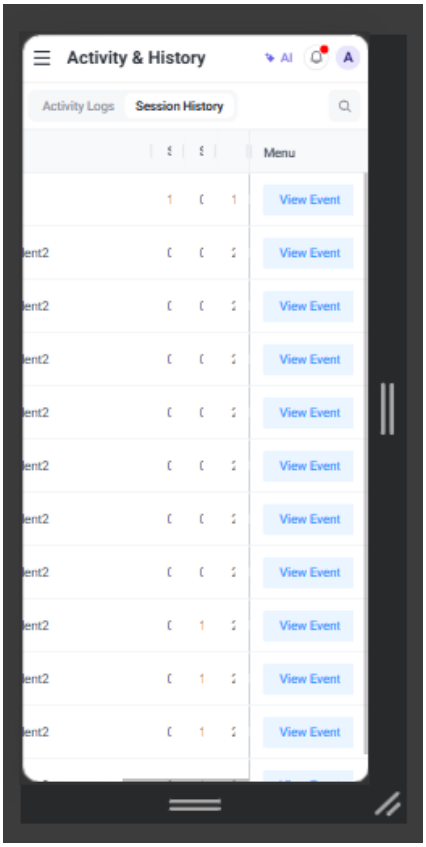

Figure 15: BUG-003 evidence: Session History at a 390 × 844 mobile web viewport.

Note: Horizontal scrolling itself was not treated as the defect; the reported issue is reduced readability and visibility of important information within the initial mobile web viewport.

Native-app limitation: The exact AbleSpace – IEP Goal Tracking App was not installed from Google Play Store or Apple App Store during this assignment. Therefore, BUG-003 is explicitly reported as a responsive web/mobile-viewport issue and not as a defect in a native mobile application.

4.4 Additional Observations

- The First Name field accepted and saved a numeric-only value. This was retained as an input-validation observation because the assignment did not define an alphabetic-only naming rule.

5. Compatibility Testing

Compatibility testing was performed on the desktop browsers and viewport emulations that were available during the assignment.

The assignment specifically requests a mobile application check. The exact AbleSpace – IEP Goal Tracking App was not available for native installation during the testing performed. Therefore, the mobile result is explicitly reported as a **web responsive-viewport check**, not as a native-app compatibility result.

5.1 Desktop and Mobile Web Compatibility Matrix

Area / Feature	Chrome	Firefox	Edge	Mobile Web 390×844	Notes
Main workflow / Caseload	PASS	PASS	PASS	PASS	Core Caseload interface loaded and was usable in all tested web environments.
Student forms / management	PASS	PASS	PASS	PASS	Student creation/edit workflow was exercised; mobile coverage focused on responsive usability.
Navigation	PASS	PASS	PASS	FAIL	Core navigation worked; the mobile Session History presentation reduced usability.
Session History	PASS	Not tested	Not tested	FAIL	Mobile web table required horizontal scrolling and reduced readability.

5.2 Tablet Compatibility

Device / Viewport	Result	Notes
iPad Mini emulation	PASS	AbleSpace Caseload loaded correctly and the student-management interface was accessible.
iPad Pro 13-inch emulation	PASS	AbleSpace Caseload loaded correctly and the student-management interface was accessible.

5.3 Compatibility Evidence

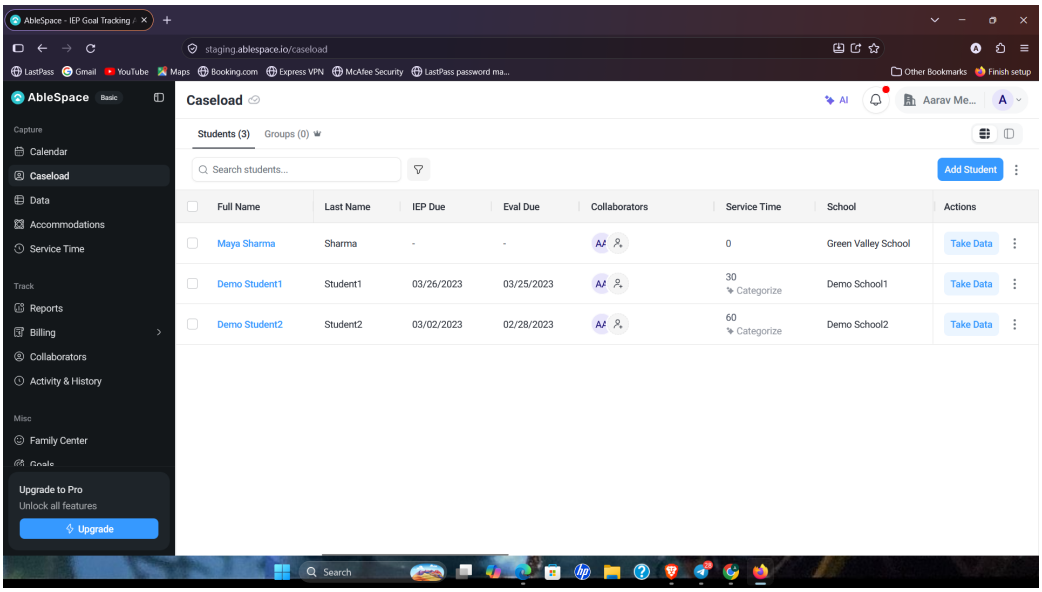

Figure 16: Firefox desktop: AbleSpace Caseload displayed successfully.

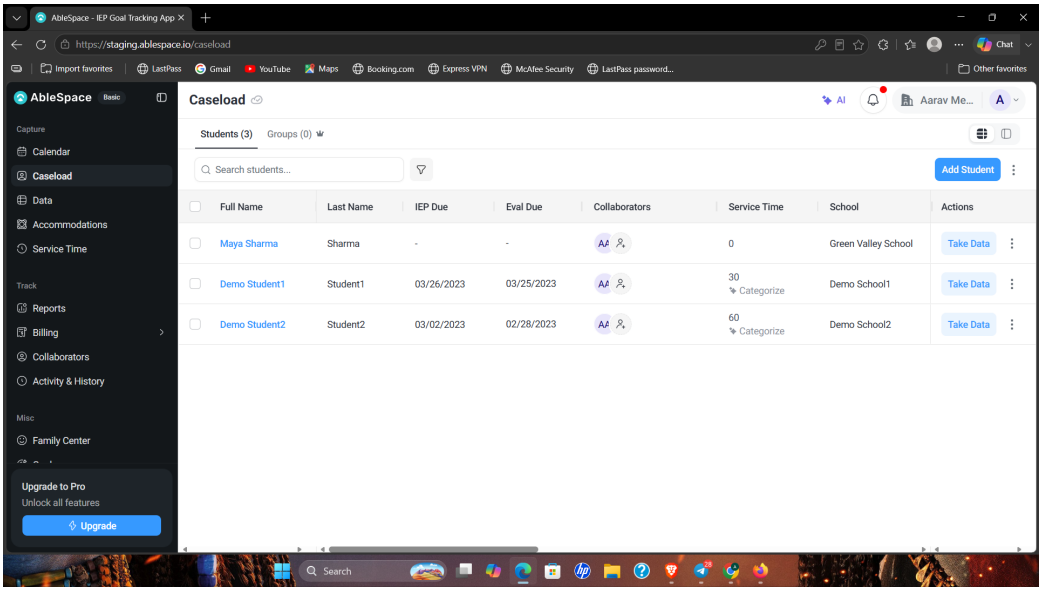

Figure 17: Microsoft Edge desktop: AbleSpace Caseload displayed successfully.

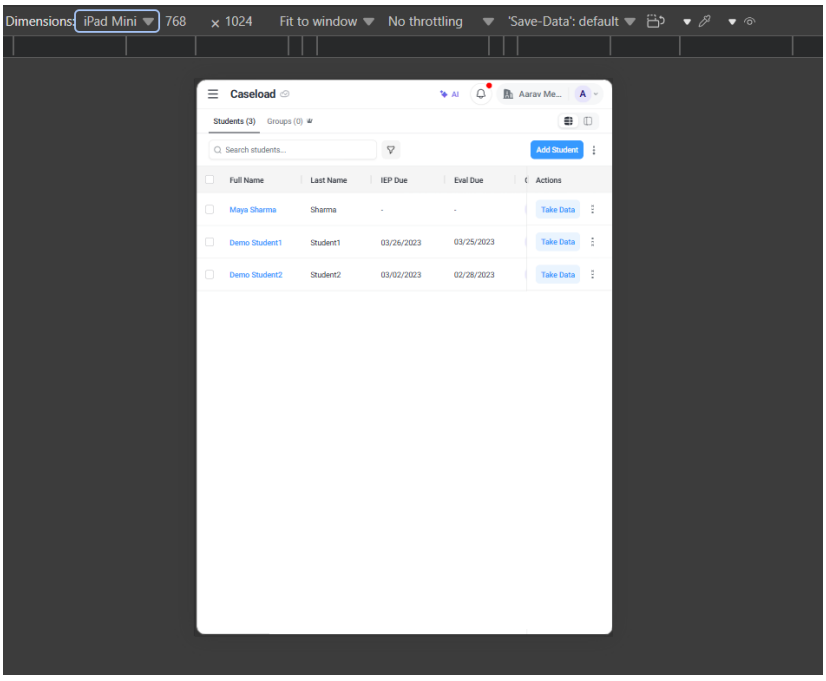

Figure 18: iPad Mini emulated viewport.

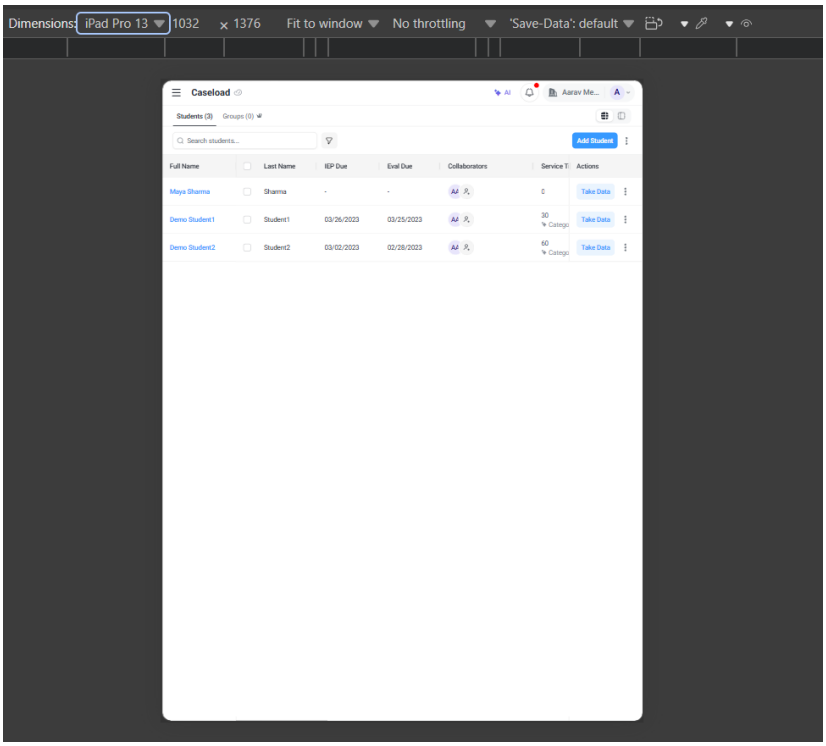

Figure 19: iPad Pro 13-inch emulated viewport.

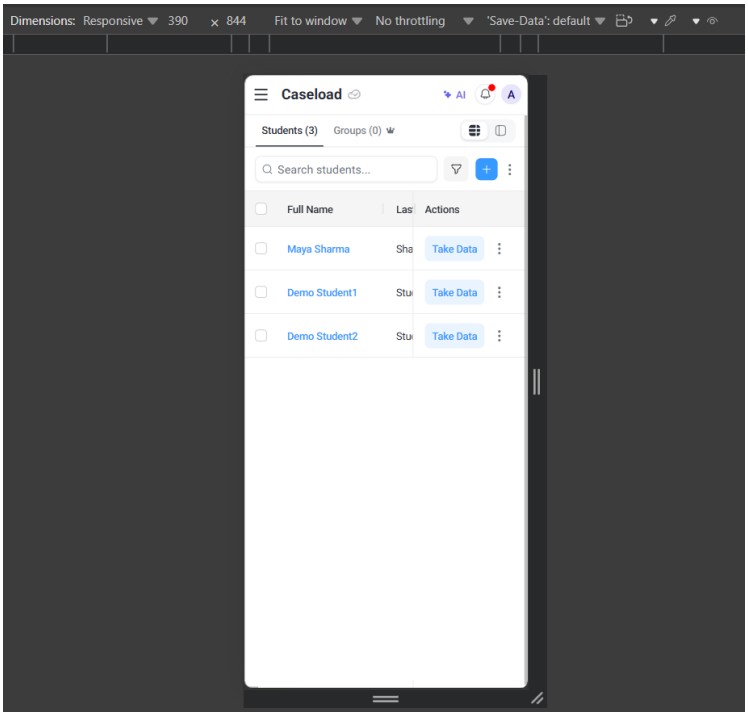

Figure 20: Mobile web viewport at 390 × 844.

5.4 Plan-Restricted and Unsent Actions

Billing functionality was not tested because the test account displayed an "Upgrade to Pro" restriction. No attempt was made to bypass the restriction.

The Collaborator page and invitation form were inspected, but no invitation was sent because the assignment prohibits contacting users.

6. Testing Summary

6.1 Testing Performed

Manual exploratory, functional, validation, usability, and compatibility testing was performed against the AbleSpace – IEP Goal Tracking App staging application.

The main areas covered were account onboarding, role selection, email verification, student creation and editing, student search, goal creation, data collection, session statistics, session editing, Activity & History, collaborator interface inspection, responsive web layout, cross-browser compatibility, and tablet emulation.

Desktop checks were performed in Google Chrome, Mozilla Firefox, and Microsoft Edge.

The main workflow was also exercised in Microsoft Edge. Responsive web checks included a 390 × 844 viewport, iPad Mini emulation, and iPad Pro 13-inch emulation.

6.2 Issues Found

Three issues were selected for detailed reporting:

1. **BUG-001** – the newly received email verification link displayed an "expired or already used" error and the application continued to indicate that the email had not been verified. This is the highest-priority issue because email verification is an account-level workflow.
2. **BUG-002** – the Role dropdown allowed an arbitrary typed value to become selectable.
3. **BUG-003** – Session History was difficult to read at the 390 × 844 mobile web viewport.

One additional input-validation observation was recorded but not promoted to the three primary bugs: the First Name field accepted and saved a numeric-only value. The assignment did not define an alphabetic-only naming rule, so this was not treated as a confirmed defect.

6.3 Areas Not Tested

The following areas were intentionally not tested or were only partially inspected:

- Security, penetration, injection, load/stress, and performance testing.
- Native mobile installation from Google Play Store or Apple App Store.
- Native mobile-app behavior of the AbleSpace – IEP Goal Tracking App.
- Billing functionality requiring a Pro subscription.
- Sending collaborator invitations.
- Creating additional user accounts.

These exclusions were made to remain within the assignment rules and avoid unintended external communication or prohibited testing activity.

6.4 What I Would Test Next

With another 1–2 hours, I would first retest the email-verification flow using one controlled resend and verify the resulting account state.

I would then expand boundary and validation testing for student and goal fields, test refresh/back-navigation and repeated actions across the main workflow, and perform a broader feature-by-feature compatibility sweep on mobile and tablet sizes.

Finally, I would regression-test the session editing paths and verify that edited session values remain consistent across Data, Capture, Graph, and Stats views.

Evidence selection note: Screenshots are included where they materially support a test result or defect. For test cases, the evidence focuses on the key interaction or final state rather than repeating visually similar screens.

A. Evidence Checklist

The following screenshots are included as supporting evidence. The filenames correspond to the image files stored in the `images/` folder used by the LaTeX document.

ID	Evidence	Filename
E-01	Account/onboarding screen	onboarding.png
E-02	Email verification error	bug-001-email-verification.png
E-03	Role dropdown arbitrary-value behavior	bug-002-role-dropdown.png
E-04	Mobile Session History readability issue	mobile-session-history.png
E-05	Student creation	student-create.png
E-06	Positive student search	student-search-positive.png
E-07	Negative student search	student-search-negative.png
E-08	Student profile/edit result	student-edit.png
E-09	Goal creation	goal-created.png
E-10	Data capture	data-capture.png
E-11	Session statistics	session-stats.png
E-12	TC-05 Edit Session dialog before editing	edit-session-dialog.png
E-13	TC-05 Edit Session dialog after editing	tc05-edited-values.png
E-14	TC-06 Data page showing persisted values	tc06-data-page.png
E-15	TC-06 Stats view showing persisted values	tc06-stats.png
E-16	Firefox compatibility	firefox.png
E-17	Edge compatibility	edge.png
E-18	Mobile web viewport 390 × 844	mobile-390x844.png
E-19	iPad Mini compatibility	ipad-mini.png
E-20	iPad Pro 13-inch compatibility	ipad-pro-13.png

B. Final Notes

All findings in this report are based on manual testing performed against the AbleSpace – IEP Goal Tracking App staging application during the stated testing period.

No root cause has been assumed for the reported issues. The report focuses on observed user-visible behavior, reproduction steps, expected behavior, actual behavior, impact, and available evidence.

The mobile Session History finding is explicitly limited to the responsive web viewport that was tested. It should not be interpreted as a defect in a native mobile application because the exact AbleSpace – IEP Goal Tracking App was not installed from a mobile app store during this assignment.

The report includes the tester's name and role on the title page. A phone number or personal contact address is intentionally omitted because the assignment does not require tester contact details.
